# Backlash to Repression

Although a primary purpose of repression is to quell dissent, it can instead spur **expanded participation or intensified efforts in mobilized dissent.**

This is often called **backlash.**

# A Backlash Review

- 91 backlash articles
- 20 years of backlash to repression in the APSR, AJPS, JOP
- Many other frequently referenced articles in subfield journals

Mechanism Category	Deters or Causes Backlash?	Backlash = dissent action or public opinion?	Citation	General or subfield journal	Players	Method

# Objective & Sequence

**A formal model to demonstrate and solve the observability and attribution challenges.**

- . Nature sets govt capacity to repress and initial repression,
  - 1. A bystander demonstrates or abstains from dissent, and
  - 2. The government and activist choose contentious strategies.

# Theory

## Utility Functions & Definition

$$u_G(e, r, d; \theta, \rho) \quad (1)$$

$$u_A(e, r, d; \theta, \rho) \quad (2)$$

$$d \cdot (u_B(e, r; \theta, \rho) - c_B) \quad (3)$$

There exists an equilibrium, characterized by the triple  $(c_B^*(\rho), e^*(d, \theta; \rho), r^*(d, \theta; \rho))$ , where Activist effort is

$$e^*(d, \theta; \rho) \in \underset{e \in [0, \bar{e}]}{\text{argmax}} u_A(e, r, d; \rho, \theta);$$

Government repression is

$$r^*(d, \theta; \rho) \in \underset{r \in [0, \bar{r}]}{\text{argmax}} u_G(e, r, d; \rho, \theta);$$

and where Bystander participates iff  $c_B \leq c_B^*(\rho)$ , where

$$c_B^*(\rho) = \int u_B(e^*(1, \theta; \rho), r^*(1, \theta; \rho), \rho; \theta) \pi_p(\theta | \rho) d\theta.$$

There exists an equilibrium, characterized by the triple  $(c_B^*(\rho), e^*(d, \theta; \rho), r^*(d, \theta; \rho))$ , where Activist effort is

$$e^*(d, \theta; \rho) \in \underset{e \in [0, \bar{e}]}{\arg \max} u_A(e, r, d; \rho, \theta);$$

Government repression is

$$r^*(d, \theta; \rho) \in \underset{r \in [0, \bar{r}]}{\arg \max} u_G(e, r, d; \rho, \theta);$$

and where Bystander participates iff  $c_B \leq c_B^*(\rho)$ , where

$$c_B^*(\rho) = \int u_B(e^*(1, \theta; \rho), r^*(1, \theta; \rho), \rho; \theta) \pi_p(\theta | \rho) d\theta.$$

**Backlash:** Increase in the bystander's incentive to demonstrate,  $c_B^*(\rho)$ , caused by an increase in initial repression,  $\rho$ .

# Observability: A Problem of Theory

1. Define backlash
2. Identify counterfactual for treatment effects
3. General assumptions for reliability

# Attribution: A Problem of Research Design

1. Derive expectations specific to each mechanism
2. Identify what to hold fixed to isolate the treatment and expected outcome

# Attribution

# Process of Analysis

To examine what must be true for each mechanism to produce observable backlash, we

1. Hold  $r$  and  $e$  fixed in the conflict and assert complete information to derive the direct effect of initial repression ( $\rho$ ) on bystander demonstration ( $d$ ) through **emotion**
2. Hold  $r$  ( $e$ ) and  $u_B$  fixed to derive the direct effect of initial repression ( $\rho$ ) on effort  $e$  ( $r$ ) and thus the indirect effect on bystander demonstration ( $d$ ) through **strategic feedback**
3. Hold  $u_B$  fixed in  $(\rho, e, r)$  to derive the direct effect of repression ( $\rho$ ) on bystander demonstration through **learning**

# Attribution

# Emotion

## *Direct Effect: Emotion*

Backlash that arises from an emotional response requires that repression increases **negative emotion** (direct effect) and that participation offsets the direct negative effects (**agency**).

# Attribution

# Strategic Feedback with the Activist

## *Direct Effect: Initial repression on effort*

Activist effort increases (decreases) as initial repression increases.

# Attribution

## Strategic Feedback with the Activist

### *Direct Effect: Initial repression on effort*

Activist effort increases (decreases) as initial repression increases.

### *Indirect Effect: Effort on participation*

Bystander participation (backlash) is increasing (decreasing) **in activist effort.**

# Attribution      Strategic Feedback with the Government

## *Direct Effect: Initial repression on repressive response*

Government repression increases (decreases) as initial repression increases.

## *Indirect Effect: Expected repression on participation*

Bystander participation is increasing (decreasing) **in expected repression.**

# Attribution

*Nota Bene*

For both the anger and logistical mechanisms, the things that increase participation also increase activist effort and vice versa.

# Attribution

*Nota Bene*

For both the anger and logistical mechanisms, the things that increase participation also increase activist effort and vice versa.

∴ Observing a larger demonstration after repression is insufficient to distinguish mechanisms.

# Attribution

# Learning

## *Requirement: Repression & type*

The bystander's posterior belief about the government's type is correlated with initial repression.

# Attribution

# Learning

## *Requirement: Repression & type*

The bystander's posterior belief about the government's type is correlated with initial repression.

## *Learning: Repression & participation*

Backlash that emerges from an informational mechanism requires that  $u_B$  increases in government capacity **as understood from initial repression.**

# Attribution

# Research Design

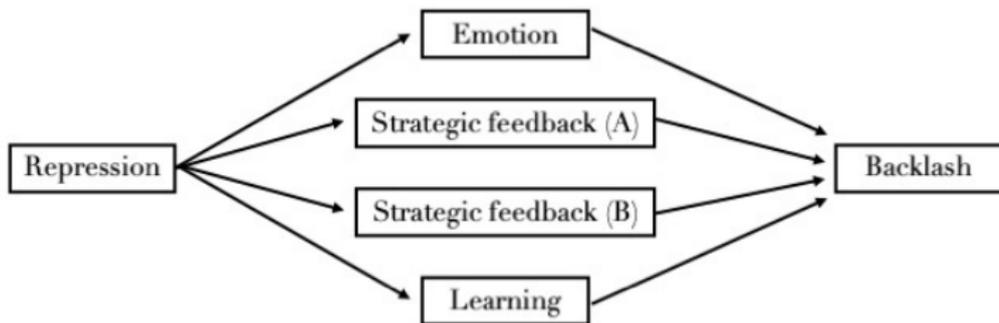

Figure: A problem of attribution

# Substantive Takeaways

- Scholarly research on backlash is varied and informative but difficult to understand as a corpus of knowledge. This is due to two causal identification problems.

# Substantive Takeaways

- Scholarly research on backlash is varied and informative but difficult to understand as a corpus of knowledge. This is due to two causal identification problems.
- **Observability:** For the concept of backlash to be determined as present from observable indicators, theories need to adhere to a common definition and include key assumptions depending on the mechanism at work.

# Substantive Takeaways

- Scholarly research on backlash is varied and informative but difficult to understand as a corpus of knowledge. This is due to two causal identification problems.
- **Observability:** For the concept of backlash to be determined as present from observable indicators, theories need to adhere to a common definition and include key assumptions depending on the mechanism at work.
- **Attribution:** A research design should sufficiently control for different mechanism characteristics to be sure as to what causal process the treatment activates.

# Broader Contributions

- Coded summary of scholarly understanding of when and how repression causes either backlash or deterrence.

# Broader Contributions

- Coded summary of scholarly understanding of when and how repression causes either backlash or deterrence.
- General formal model of backlash with four possible causal mechanisms from first repression to second political contest

# Broader Contributions

- Coded summary of scholarly understanding of when and how repression causes either backlash or deterrence.
- General formal model of backlash with four possible causal mechanisms from first repression to second political contest
- Clear guidance for improved and precise theories of reactive dissent to empirically identify it as backlash in the wild.
- Suggestions for research designs to more effectively attribute backlash or deterrence to specific mechanisms.
