Projections of the Population of Texas and Counties in Texas by Age, Sex, and Race/Ethnicity from 2010 to 2050

Nazrul Hoque, *University of Houston*

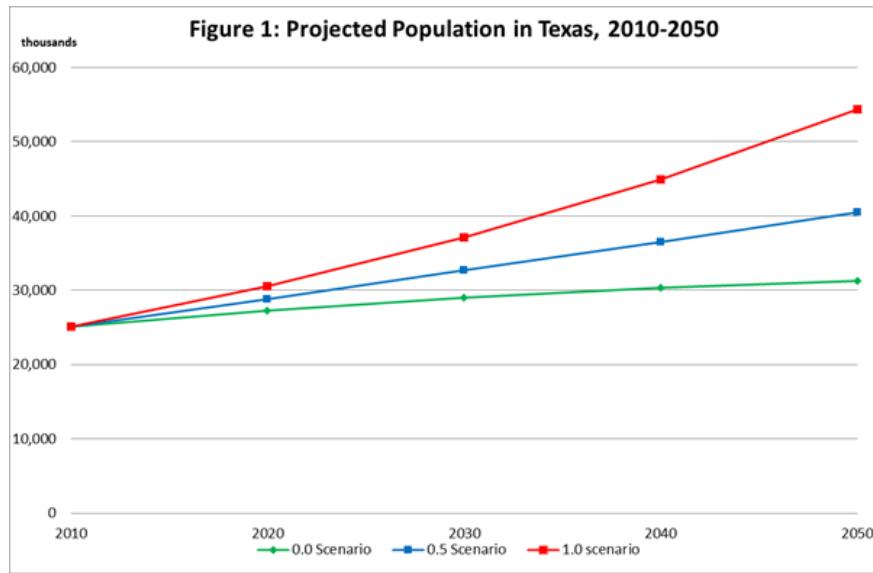

This report examines the future demographic changes underway in the State of Texas using the latest population projections data available from the Hobby School of Public Affairs. Texas is one of the fastest growing states in the United States. The population of Texas will increase from 25.1 million in 2010 to 31.2, 40.5 or 54.4 million in 2050, depending on the projection scenario. A large portion of the increase is projected to be caused by migration (both in-migrants and immigrants). Texas population will become increasingly ethnically diverse. Under the 1.0 scenario, the Hispanic population is expected to surpass the Anglo population by 2017. The population will also become older than it is at present. Under 1.0 scenario, the proportion of population 65 years of age or older will increase from 10.3 percent in 2010 to 17.4 percent in 2050. As policy makers, businesses, and nonprofit organizations deliberate on the growth and prosperity of Texas in the future, they need to consider these demographic trends.

Keywords: cohort component method, fertility, mortality, migration, population projections.

Introduction

Population projections for the State of Texas and its 254 counties by age, sex, and race/ethnicity from 2010 to 2050 are available from the Hobby School of Public Affairs website. It can be obtained from the **TXVIEW** icon. It contains both the software and data. Detailed instructions on how to obtain these data are given in Appendix 1.

These projections were prepared by the personnel of the Hobby School of Public Affairs and the Texas State Data Center. Population projections were completed using a cohort-component projection technique. The basic characteristics of this technique are the use of separate cohorts - persons with one or more common characteristics - and the separate projection of each of the major components of population change – fertility, mortality, and migration for each cohort. The scenarios shown make the same assumptions about birth and death rates but assume different net migration rates based on alternations of 2000 to 2010 age, sex, and race/ethnicity specific patterns of net migration. The 0.0 scenario assumes net migration is equal to zero (meaning there is no migration or in and out migration are equal) and growth occurred only as a result of natural increase (the difference between the number of births and number of deaths). The 0.5 scenario assumes rates of net migration equal to one-half of the 2000-2010 trend and the 1.00 scenario assumes a continuation of 2000-2010 patterns of the net migration. Texas is one of the fastest growing states in the United States. The population of Texas will increase from 25.1 million in 2010 to 31.2, 40.5 or 54.4 million in 2050 depending on the projection scenario (Figure 1 and Table 1). Since most of the tables are large, all of the tables are presented at the end of the text (starting on page 14).

Projections are shown for the total population and for each of four racial/ethnic groups – Non-Hispanic White (Anglo), Non-Hispanic Black or African American, Hispanic of all races and Non-Hispanic Others (mainly Asian and Others). These consist of the census categories: Non-Hispanic White alone, Non-Hispanic Black or African American alone, Hispanics of all races, and persons in all other non-Hispanic racial groups referred to as the Other population group. The Other population group also includes all persons listing two or more races.

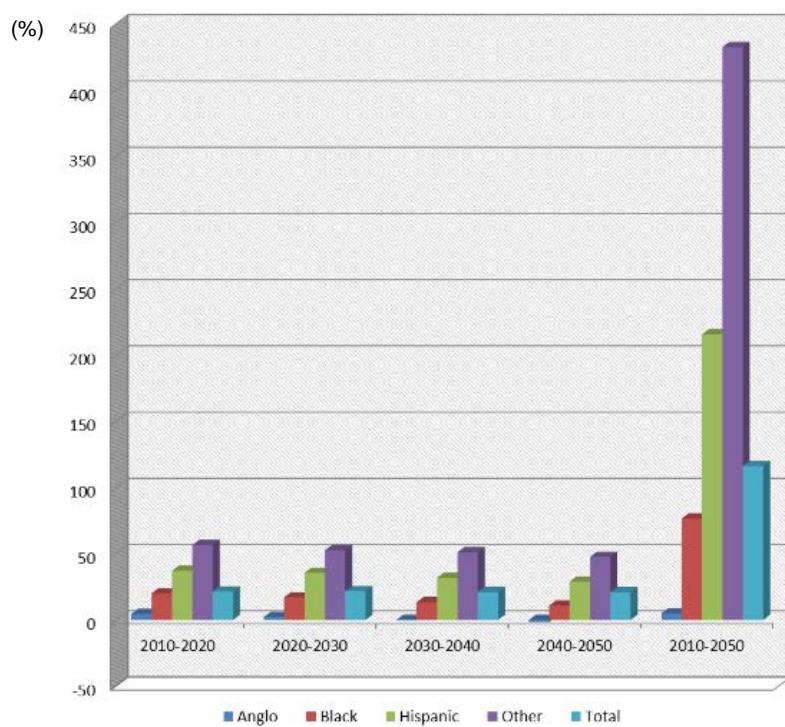

The data in Table 1 suggests that Texas population will continue to grow and will be increasingly diverse. From 2010 to 2050, under the 0.0 migration scenario, Texas population would increase from 25,145,561 to 31,246,355 in 2050. This growth represents an annualized rate of growth of 0.6 percent for the total projection period of 2010 through 2050. Under the 0.5 migration scenario, Texas population would increase to 40,502,749 million in 2050 with an annualized growth rate of 1.5 percent. Under the 1.0 migration scenario, Texas population would increase to 54,369,297 million in 2050 with an annualized growth rate of 2.9 percent.

What is equally evident from the data in Table 1 is that the projected growth will involve substantial levels of net immigration. Under the 0.50 scenario, net migration would be 9,256,394, and under 1.0 scenario, net migration would be 23,122,942. Although it is impossible to discern what proportion of the projected net migration would involve immigration from other states versus immigration from other nations, under the 1.0 scenario, a substantial proportion of the total growth would be due to immigrants and immigrants, and their descendants. What this suggests is that the future growth of the Texas population is likely to be impacted by events that occur outside the State rather than relying on natural increase of current residence. The 0.0 scenario shows that Texas would increase its population by more than 0.6 percent per year even if its only growth were through natural increase. In other words, even if Texas experienced no net immigration or immigration, its population would grow as rapidly as that projected for the Nation. Under a wide array of circumstances, Texas population is likely to continue to grow in the coming decades.

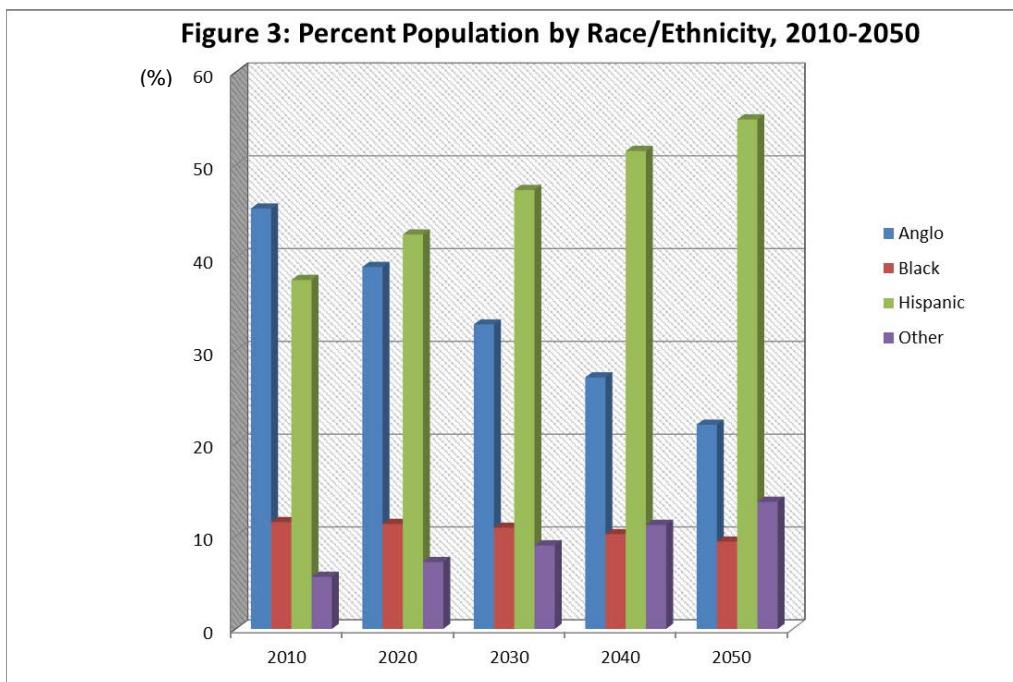

Continuing Growth in Minority Populations, 2010-2050

The data in Tables 2 and 3 and also in Figures 2 and 3 shows that the pattern of rapid growth in minority populations in recent decades is likely to continue but the ethnic differentials in rates of growth are most represented by Table 2. For example, from 2010 to 2050 under the 0.0 scenario, the Anglo population is projected to decline by 6.8 percent, but the Black population increases by 12.4 percent, the Hispanic population by 64.4 percent, and the Other population by 30.9 percent. Under the 0.5 scenario, the Anglo population is projected to decline by only 1.2 percent while the Black population would increase by 40.8 percent, the Hispanic population would increase by 127.4 percent, and the Other population by 161.0 percent. Under the 1.0 scenario, the Anglo population is projected to grow by only 4.9 percent, the Black population would increase by 76.6 percent, the Hispanic population by 215.6 percent, and the Other population by 432.5 percent.

Figure 2: Population Change for Selected Time Periods by Race/Ethnicity

As a result of such differentials in growth, the proportion of the population that is minority increases rapidly. Under the 1.00 scenario the proportion of Anglo population decreases from 45.3 percent in 2010 to 22.0 percent in 2050. Black population decreases from 11.5 percent in 2010 to 9.4 percent in 2050. On the other hand, the proportion of the population that is Hispanic increases from 37.6 percent in 2010 to 54.9 percent by 2050. Other population increases from 5.6 percent in 2010 to 13.7 percent by 2050.

Examined in terms of the total impact of each ethnic group on the net change in the population of Texas, under 0.0 scenario more than 100 percent of the growth would be due to minority population growth. The reason being Anglo population will have below replacement fertility level. Under 1.0 scenario, 98.1 percent of the net growth in the population of Texas from 2010 to 2050 would be due to minority population growth (see Table 3). The Anglo population would account only for 1.9 percent of the growth, the Black population for 7.6 percent, the Hispanic population for 69.8 percent, and the Other population for 20.7 percent of the total net population change in the population of Texas from 2010 through 2050. Texas population growth will be increasingly dependent on minority population growth with Hispanics playing a particularly important role in the growth of minority populations in the State.

An Aging Population, 2010-2050

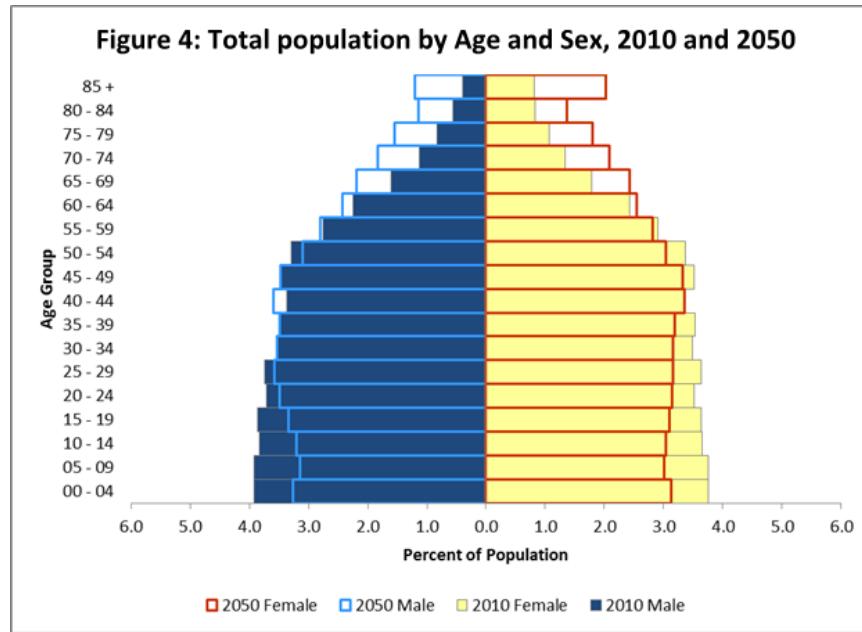

Texas population is relatively young with a median age of 33.6 years in 2010, the second youngest population of any state in the United States (only Utah had younger populations). The projections of the age distribution of Texas future population is shown in Tables 4 and 5. As the data in these tables suggest, Texas population will age substantially over 40 years. The population 65 years of age or older was only 10.3 percent of the total population in 2010 (compared to 13.0 percent in the nation as a whole) but would increase to 19.5 or 17.4 percent by 2050 depending on the migration scenario of 0.5 and 1.0, respectively. Similarly, median age would increase from 33.6 in 2010 to 39.3 or 38.5 in 2050, depending on the migration scenario of 0.5 or 1.0. Under 1.00 Scenario, the median age for Anglo would increase from 41.3 in 2010 to 46.8 by 2050, the median age for Black would increase from 32.1 to 42.7 by 2050, the median age for Hispanic would increase from 27.0 to 34.8 by 2050, and for Others it would increase from 31.2 to 39.0 by 2050.

Two aspects of the aging process are important to note. First, the aging process is more

accentuated in the first part of the projection period than during the second part of the period. Under the 1.0 scenario, the proportion of the population that is 65 years of age or older shows rapid increase from 2010 to 2030 and level by 2040. The proportion of population that is 65 years of age and over increases from 10.3 percent in 2010 to 13.1 percent in 2020 and 16.0 percent in 2030. By 2040, however, the percent of the population that is elderly increases only to 16.9 percent and by 2050 it is 17.4 percent. The reason that the elderly population increases more rapidly after 2010 is because of the impact of the baby-boom generation. This group which includes those persons born in the years 1946 through 1964 was approximately one-third of the Texas population in 2010. Since their numbers are so large, changes in their ages disproportionately impact the overall age structure of the population. This group begins to enter elderly ages in 2011. At present, it might be more appropriate to refer to Texas population as a middle-age population rather than an elderly population.

A second important feature of the aging process in the Texas population is that it varies widely by ethnicity. In 2010, 15.4 percent of Anglos were 65 years of age or older but only 7.6 percent of Blacks, 5.6 percent of Hispanics and 6.5 percent of the Other population were in elderly ages. Although all ethnic populations show increased aging over the projection period, by 2050 (under the 1.0 scenario), the proportion of the Anglo population that is 65 years of age or older increases to 28.0 percent while the Black and Hispanic populations show 19.9 and 13.3 percent respectively in the elderly ages by 2050. The Other population will increase from 6.5 percent in 2010 to 14.9 percent in 2050.

The comparison of population pyramids for 2010 and 2050 shows that the Texas's population is projected to continue to age due to low fertility and higher life expectancy. The proportion of children (under age 15) expected to decline from 22.8 percent in 2010 to 18.8 percent in 2050. The proportion of population 65 years of age and older expected to increase from 10.3 percent in 2010 to 17.4 in 2050. The proportion of working age population is expected to decline from 66.9 percent in 2010 to 63.8 percent in 2050. As a result dependency ratio will increase from 49.6 in 2010 to 56.7 in 2050. Aged dependency ratio will increase from 15.5 in 2010 to 27.2 in 2050 which means in 2010 there were 6.5 working age people for each person of 65 years of age and above while in 2050 there would be less than 4 persons.

Overall, then, the projected population patterns for Texas suggest that it will likely continue to show relatively high rates of growth. This growth, together with the existing characteristics of the population, will increase the ethnic diversity of the population and cause it to become an increasingly older population with the demands on services associated with increased age and diversity.

Patterns and Trends for Metropolitan Statistical Areas in Texas, 2010-2050

In this section, we briefly examine the trends in population growth, ethnicity and age projected to occur in the 25 Metropolitan Statistical Areas (MSAs) in Texas. Because of the large number of areas involved, only summary data are presented in this section. In addition, because of the large number of individual MSAs, the discussion emphasizes patterns among MSAs for the total projection period from 2010 to 2050 but data for intermediate periods are shown in the tables. In most cases, trends between 2010 and 2050 are incremental so that one can assume that the direction of the trend from 2010 to 2050 applies to intermediate periods as well.

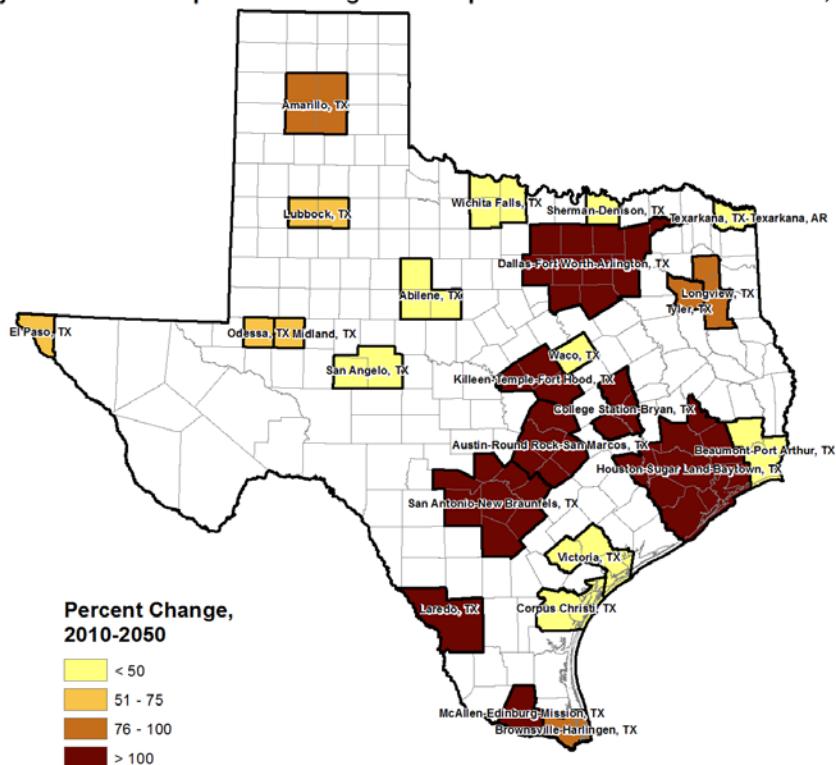

The data in Tables 6 and 7 shows that the Metropolitan Statistical Areas are expected to generally maintain their relative order by population size except San Antonio-New Braunfels. Under 1.0 scenario, Dallas-Fort Worth-Arlington would remain the largest MSA with a projected population of 16,367,293 million, followed by the Houston-The Woodlands-Sugar Land MSA with a projected population of 14,221,267 million. In 2050, Austin-Round Rock would be the third largest MSA with a population of 5,176,940 million. San Antonio-New Braunfels would be the fourth largest MSA in 2050 with a population of 4,294,232 million. These four MSAs contained 64.5 percent of the State's population in 2010 and are projected (under the 1.0 scenario) to account for almost 74 percent of the total population of Texas by 2050.

Under 1.00 scenario, Dallas-Fort Worth-Arlington MSA would increase its population from 6,426,214 in 2010 to 16,367,293 in 2050. Houston-The Woodlands-Sugar Land MSA would

increase its population from 5,920,416 in 2010 to 14,221,267 in 2050. During the projection period, under 1.00 scenario, Dallas-Fort Worth-Arlington MSA would gain the most population of 9,941,079, followed by Houston-The Woodlands-Sugar Land MSA with a gain of 8,300,079, and Austin-Round Rock with a gain of 3,460,651 persons.

In terms of percent population change, under 1.00 scenario, Austin-Round Rock would gain the most, with an increase of 201.6 percent during the projection period of 2010-2050, followed by Dallas-Fort Worth-Arlington MSA with an increase of 154.7 percent, Houston-The Woodlands-Sugar Land with an increase of 140.2 percent, McAllen-Edinburg-Mission with an increase of 129.7 percent, and the Killeen-Temple MSA with an increase of 112.9 percent. The Laredo MSA is projected to increase its population by nearly 111.7 percent from 2010 to 2050. Texarkana MSA would gain the least population during the projected period (5.9 percent).

Figure 5: Projected Percent Population Change in Metropolitan Statistical Areas in Texas, 2010-2050

Overall the data in Table 6 suggest that growth will continue to be concentrated among the State's largest metropolitan areas and in areas along the Texas-Mexico border with reduced rates of growth occurring in the more rural parts of the State. In fact, the four largest MSAs contained 64.5 percent of the population of Texas in 2010 and are projected to contain (under the 1.0 scenario) 73.7 percent of the population in 2050. Data in Tables 7, 8 and 9 also suggests that for nearly all MSAs, as for the State as a whole, the growth of minority populations is projected to be pervasive. In virtually all areas, minority growth exceeds that for the Anglo population. In most MSAs Anglo decline will be offset by minority increase. Similarly, the proportion of the total population that is minority would increase rapidly. Under 1.00 scenario, the minority population

will increase in Abline MSA from 31.7 percent in 2010 to 55.7 percent in 2050, Amarillo from 35.4 percent in 2010 to 69.6 percent in 2050, Austin-Round Rock MSA from 45.3 in 2010 to 69.0 percent in 2050, Beaumont-Port Arthur from 40.7 percent in 2010 to 67.1 in 2050, Brownsville-Harlingen MSA from 89.3 percent to 96.6 in 2050, Bryan-College Station from 40.1 percent in 2010 to 64.8 in 2050, Corpus Christi from 63.6 percent in 2010 to 82.8 percent in 2050, Dallas-Fort Worth-Arlington MSA from 49.5 percent in 2010 to 78.4 percent in 2050, El Paso from 86.9 percent in 2010 to 95.4 percent in 2050, Houston-The Woodlands-Sugar Land from 60.4 to 83.8 in 2050, Killen-Temple MSA from 45.9 to 67.7 percent in 2050, Laredo MSA from 96.6 percent in 2010 to 98.5 in 2050, Longview MSA from 34.0 percent in 2010 to 68.1 percent in 2050, Lubbock from 43.1 percent in 2010 to 65.8 percent in 2050, McAllen-Edinburg-Mission MSA from 92.2 percent in 2010 to 96.1 percent in 2050, Midland from 46.8 percent in 2010 to 76.5 percent in 2050, Odessa MSA from 58.9 percent in 2010 to 86.0 percent in 2050, San Angelo MSA from 41.9 percent in 2010 to 63.1 percent in 2050, San Antonio-New Braunfels MSA from 64.0 percent in 2010 to 78.0 percent in 2050, Sherman-Denison MSA from 21.3 percent in 2010 to 56.4 in 2050, Texarkana from 33.7 percent in 2010 to 54.8 percent in 2050, Tyler MSA from 37.8 percent in 2010 to 69.8 percent in 2050, Victoria MSA from 51.3 percent in 2010 to 72.8 percent in 2050, Waco MSA from 41.6 percent in 2010 to 69.7 percent in 2050, and Wichita Falls from 28.6 percent in 2010 to 53.6 percent in 2050.

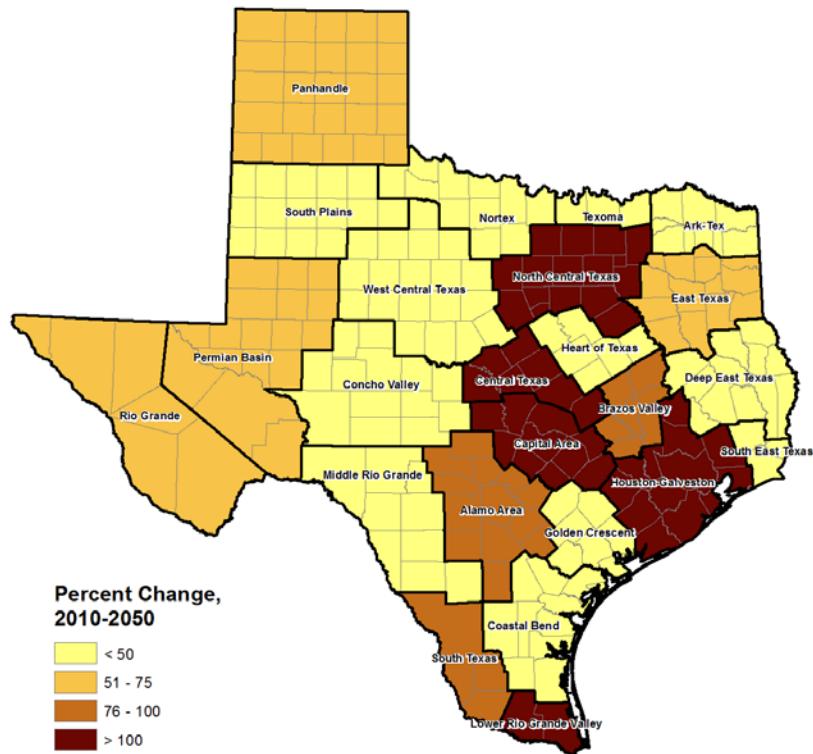

In 2010, 16 of 25 MSAs had 50 percent or more of Anglo population, but under the projected population none of the MSAs would have 50 percent or more of the Anglo population in 2050. Finally, the pervasiveness of minority population growth is evident in the data in Table 8 which indicate that the number of Anglos would show an absolute decline in 19 of 25 MSAs of the State from 2010 to 2050 and there would not be a single Region in which Anglo population growth would account for a majority of that MSAs population growth.

Patterns and Trends for Council of Government Regions in Texas, 2010-2050

In this section, we briefly examine the trends in population growth, ethnicity and age projected to occur in the 24 Council of Government (COG) Regions in Texas. Because of the large number of areas involved, only summary data are presented in this section. In addition, because of the large number of individual COG Regions, the discussion emphasizes patterns among COGs for the total projection period from 2010 to 2050 but data for intermediate periods are shown in the tables by race/ethnicity. In most cases, trends between 2010 and 2050 are incremental so that one can assume that the direction of the trend from 2010 to 2050 applies to intermediate periods as well.

The data in Table 10 shows that the Council of Government Regions are expected to generally maintain their relative order by population size. In 2050, as in 2010, the North Central Texas COG containing Dallas and Fort Worth would be the largest Region of the State, followed by the Houston-Galveston COG. In 2010, The Capital Area Planning Council (which includes the City of Austin) was fourth largest Council of Government region, however, by 2050 it would be the third largest council of Government Regions. In 2010, the Alamo Area COG (which includes the City of San Antonio) was the third largest Council of Government Region, by 2050 it would be the fourth largest Region. These four Council of Government Regions contained 66.4 percent of the State's population in 2010 and are projected (under the 1.0 scenario) to account for 75.0 percent of the total population of Texas by 2050.

Figure 6: Projected Percent Population Change in Texas Council of Governments Regions, 2010-2050

However, due to quite different rates of overall growth, the relative population sizes of the areas would change dramatically such that the North Central Region would become substantially larger than the Houston-Galveston Region by 2050. If the projected patterns prevail (under the 1.0 scenario), the North Central Texas Region would have a population of more than 16.5 million in 2050 compared to 14.4 million in the Houston-Galveston Area. Similarly, although the population of the Alamo Area COG was more than 60 percent larger than that for the Capital Area Planning Region in 2010, by 2050, the Capital Area is projected (under the 1.0 scenario) to have a more population than the Alamo Area, 5.4 and 4.5 million, respectively. Under 1.00 scenario, the North Central Texas COG would gain the most population with 10.0 million, followed by the Houston-Galveston COG with a gain of 8.3 million, the Capital Area with a gain of 3.5 million, Alamo Area with a gain of 2.2 million, Lower Rio Grande Valley with a gain of 1.4 million.

In terms of percent population change, Capital Area would increase its population by 192.8 percent, followed by North Central Texas by 152.9 percent, Houston-Galveston by 136.8 percent, Lower Rio Grande Valley by 112.9 percent, Central Texas by 103.4 percent, Alamo Area 97.8 percent, South Texas by 93.3 percent. Concho Valley is expected to increase its population by only 11.3 percent from 2010 to 2050.

Overall the data in Tables 10 and 11 suggest that growth will continue to be concentrated among the State's largest metropolitan centers and in areas along the Texas-Mexico border with reduced rates of growth occurring in the more rural parts of the State. In fact, if one examines the proportion of the State's population accounted for by the eight largest Regions in 2010 and those eight projected to decrease or increase less than 10 percent from 2010 to 2050, the concentration

of population in the State is evident. The eight largest regions contained 75.6 percent of the population of Texas in 2010 and are projected to contain (under the 1.0 scenario) 84.1 percent of the population in 2050. On the other hand, those eight areas with the slowest population growth from 2010 to 2050 contained 12.4 percent of the State's population in 2010 but would have only 6.1 percent in 2050. The future distribution of the Texas population thus promises to present significant and diverse challenges for service provision. Substantial increases in services will be required in large metropolitan centers and along the Texas-Mexico border while even fewer people will be spread over large areas to be served in other regions. As a result of the expected patterns of population distribution in Texas, both problems of creating sufficient services in time to meet the needs of rapidly growing areas and those of providing adequate access to services in sparsely settled areas are likely to remain realities of service provision in Texas.

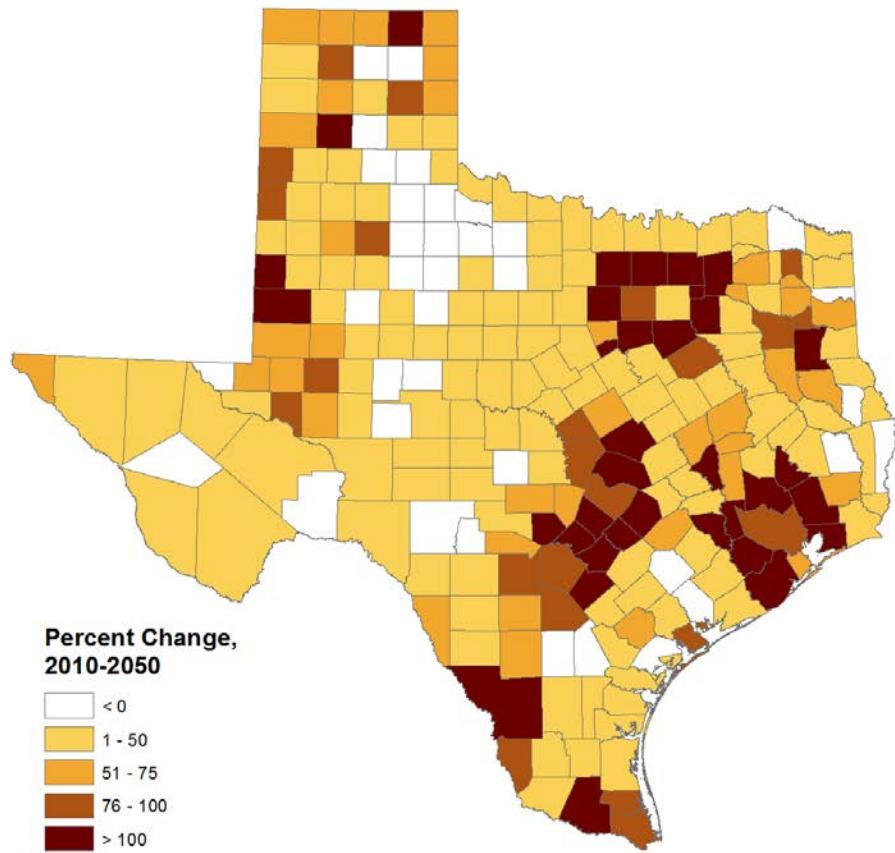

Data in Tables 9 through 13 show that in nearly all COGs, as for the State as a whole, the growth of minority populations is projected to be pervasive. In virtually all areas, minority growth exceeds that for the Anglo population. Similarly, the proportion of the total population that is minority would increase rapidly. In 2010, only the Alamo Area (37.2 percent), Coastal Bend (34.0 percent), Houston-Galveston (39.9 percent), Lower Rio Grande (8.8 percent), Middle Rio Grande (15.1 percent), Permian Basin (46.5 percent), Rio Grande (13.8 percent), and South Texas (3.6 percent) COGs were less than 50 percent Anglo population. In sum, in 2010 there were only 8 of 24 Council of Government Region with Anglo population less than 50 percent while by 2050 (under the 1.0 scenario), all of the State's 24 COG Regions would have less than 50 percent Anglos population. Finally, the pervasiveness of minority population growth is evident in the data in Table 12 which indicate that the number of Anglos would show an absolute decline in 19 of 24 regions of the State from 2010 to 2050 (under the 1.0 scenario) and there would not be a single region in which Anglo population growth would account for a majority of that region's population growth.

The final pattern noted for the State that is also evident for COGs is that of the aging of the population (see Tables 12). Although there is clear evidence of differences in median ages among regions (as regions with larger minority populations generally have lower median ages), the pervasiveness of the aging trend is evident. In all regions the median age of the population in 2050 is older than in 2010 (under the 1.0 scenario). Larger proportions of elderly persons will be a reality impacting service needs in virtually every Region of the State in the Twenty-First Century.

Patterns and Trends in Counties in Texas, 2010-2050

In this section, we briefly examine the patterns and trends of population change in Texas Counties. Under 1.00 scenario, during the projected period Harris county will gain the most population (3,435,368) and retain its status as the most populous county in Texas. Collin county will gain the second most with an increase of 3,019,499 persons, followed by Denton county with an increase of 2,368,983 persons, Fort Bend with an increase of 2,153,178 persons, and Tarrant 1,688,000. Under the same scenario, Newton county will lose the most (2,872), followed by Coke county (958), and Hutchinson county (883), Jackson (709), and Fisher (679).

Figure 7: Projected Percent Population Change in Texas Counties, 2010-2050

In terms of percent population change, under 1.00 scenario, Hays county will gain the most with an increase of 424.5 percent, followed by Collin county increasing by 386.0 percent, Fort Bend county increases by 367.8 percent, Williamson county increases by 367.7 percent, and Denton county will increase by 357.5 percent. Loving county may lose the most with a decline of 51.2 percent, followed by Coke county with a decline of 28.9 percent, Motley county with a decline of 24.1 percent, and Newton (19.9). In sum, 36 of 254 counties may lose population during the projections period under 1.00 scenario (Table 14).

Summary and Implications

In this section we describe the basic demographic changes projected to impact Texas and regions in Texas through 2050. The results show several important patterns including:

1. Texas population is likely to increase substantially under a wide variety of circumstances. Thus, under the 1.0 scenario that assumes 2000-2010 patterns of net immigration, the population of the State would reach 54,369,273 million by 2050, an increase of more than 116 percent from 2010. Even under the assumption that growth occurs only as a result of natural increase (that net

migration is zero), the population of the State would increase by nearly 4.8 million from 2010 to 2050, an increase of 24.3 percent.

2. A large proportion of the increase under the 1.0 scenario is projected to be due to immigration to Texas from other states and territories of the United States and from immigration to Texas from other nations. More than 79 percent of the net growth in the State's population is projected to be due to in-migrants, immigrants, and their descendants.

3. Texas population will become increasingly ethnically diverse. Whereas the Anglo population (under the 1.0 scenario) is projected to increase by 4.9 percent from 2010 to 2050, the Black population would increase by 76.6 percent, the Hispanic population by 215.6 percent, and the Other population by 432.5 percent. By the 2050, the proportion of the population that is Anglo would be only 22.0 percent while the Hispanic population would account for 54.9 percent, the Black population for 9.4 percent, and the Other population for 13.7 percent of the total population of Texas. Of the total net change in the population of Texas from 2010 to 2050, 98.1 percent is projected to be due to growth in the minority population of the State. Under the 1.0 scenario, Hispanic population expected to surpass the Anglo population by 2017. In 2017 the proportion of Hispanic population would be 41.0 percent compared with Anglo proportion of 40.9 percent.

4. The population will also become older than it is at present. By 2050, 17.4 percent of the population, compared to 10.3 percent in 2010, would be 65 years of age or older under 1.0 scenario. Most of the aging of the population in proportional terms will occur during the periods of 2010 to 2030 when the baby boomers (those born between 1946 and 1964) begin to enter elderly ages. Thus, between 2010 and 2030, the population 65 years of age and older shows the most rapid proportional growth of any age group, increasing from 10.3 percent in 2010 to 13.1 in 2020, and 16.0 percent of the population by 2030.

5. Texas population in the early part of the next century will likely be characterized by growth, diversity and maturity. The demands likely to be placed on State services can be expected to reflect these characteristics.

6. Patterns of regional population change show rapid population growth in the State's large urban centers with growth in the North Central Region, Houston-Galveston, Capital Area, and Alamo Area COGs potentially leading to very large urban concentrations (all with more than 2 million persons) in these regions by 2050. In addition, rapid growth is projected to occur in regions along the Texas-Mexico border. Slow growth will occur in the Panhandle, South East Texas and West Texas. Overall, the patterns of regional growth examined here suggest a further concentration of the Texas population.

7. Changes in ethnic and age characteristics projected for the State are generally pervasive across regions of the state. In 2010, there were 16 of Council of Government regions with more than 50 percent of their population Anglo. By 2050, none of the 24 regions would have more than 50 percent of the population Anglo and all 24 regions would increase their minority proportions. Similarly, all 24 regions show an aging of their population bases over the projection period.

Overall, then, the data in this report show Texas to be a state with a population which is likely to experience substantial growth in the coming decades and one which will likely become increasingly diverse and mature. The results show that such growth will not be as evident in the State's rural areas as in its larger metropolitan areas and in regions along the Texas-Mexico border. However, the patterns of increasing diversity are likely to occur in virtually all parts of the State. Although all projections are subject to error and must be used with caution, it appears that the Texas population is one that will likely grow and require substantial additional services, and an increasing diversity of services, in the coming decades.

Acknowledgement

The author would like to acknowledge the help of Dr. Jeffrey A. Jordan for producing the Figures 5 through 7. The author would also like to acknowledge the help of Lisa Espinoza for formatting all the tables and Beverly Pecotte for editorial assistance.

Appendix 1: Instructions for TXVIEW (population projections)

Population projections for the State of Texas and its 254 counties by age, sex, and race/ethnicity from 2010 to 2050 are available from the Hobby School of Public Affairs website. It can be obtained from the **TXVIEW** icon. It contains both the software and data.

These projections were prepared by the personnel of the Hobby School of Public Affairs and the Texas State Data Center. Population projections were completed using a cohort-component projection technique. The basic characteristics of this technique are the use of separate cohorts that is, persons with one or more common characteristics, and the separate projection of each of the major components of population change that is, fertility, mortality, and migration for each cohort. The scenarios shown make the same assumptions about birth and death rates but assume different net migration rates based on alternations of 2000 to 2010 age, sex, and race/ethnicity specific patterns of net migration. The 0.0 scenario assumes net migration is equal to zero (meaning there is no migration or in and out migration are equal) and growth occurred only as a result of natural increase (the difference between the number of births and number of deaths). The 0.5 scenario assumes rates of net migration equal to one-half of the 2000-2010 trend and the 1.00 scenario assumes a continuation of 2000-2010 patterns of the net migration.

Installation and usage are quite simple:

- 1) Save the attachment (**TXVIEW**) to your desktop.
- 2) Double-click on it to extract the archive to your desktop (or drag the TXVIEW folder inside the zip archive to your desktop if you are using windows built-in archive handling)
- 3) Double-click the **TXVIEW** folder to enter it.
- 4) Locate the file **TXVIEW.exe** and double-click on it (this will launch the application).
- 5) Make the application full-screen by dragging the GIS panel to the far right top corner, Time panel to the left bottom corner, and Query Panel (demographics) to the far right corner. This will make it easier to view the data (see Figure 1).
- 6) Select File and then Load Data from the menu. Click twice on the data directory and choose data files from prjpop_000.dat, prjpop_050.dat, or prjpop_100.dat. prjpop_000.dat for 0.0 projection scenario, prjpop_050.dat for 0.5 projection scenario, and prjpop_100.dat. Select the desired scenario and click to open. This will load the data file.
- 7) Hit ok on the "load completed" popup. You now have the desired scenario in memory and can begin to view and manipulate the data.
- 8) Select the desired year from the left bottom corner of the panel called Time Panel. Data is available from 2010 to 2050. Time menu gives users the ability to skip forward or backward to obtain the desired timeline.
- 9) The Query Panel allows you to extract data based on their demographics and county selection.

For example, if you are interested to find out the Anglo Male population of 0-5 years of age for Bexar County, you will highlight Anglo Males, then highlight Age 0-5 and then you will highlight Bexar County. You will get the Anglo male population 0-5 years of age for Bexar County (see Figure 2).

- 10) GIS panel allows users to modify the map displayed in the Main Window.
- 11) You can select the county from the selection menu or by clicking on the map for the desired county.
- 12) You can also save the data in an excel file for future use.

Figure 1: GIS panel is on the top right corner, Time Panel is on the left bottom corner and Query Panel is on the right bottom corner.

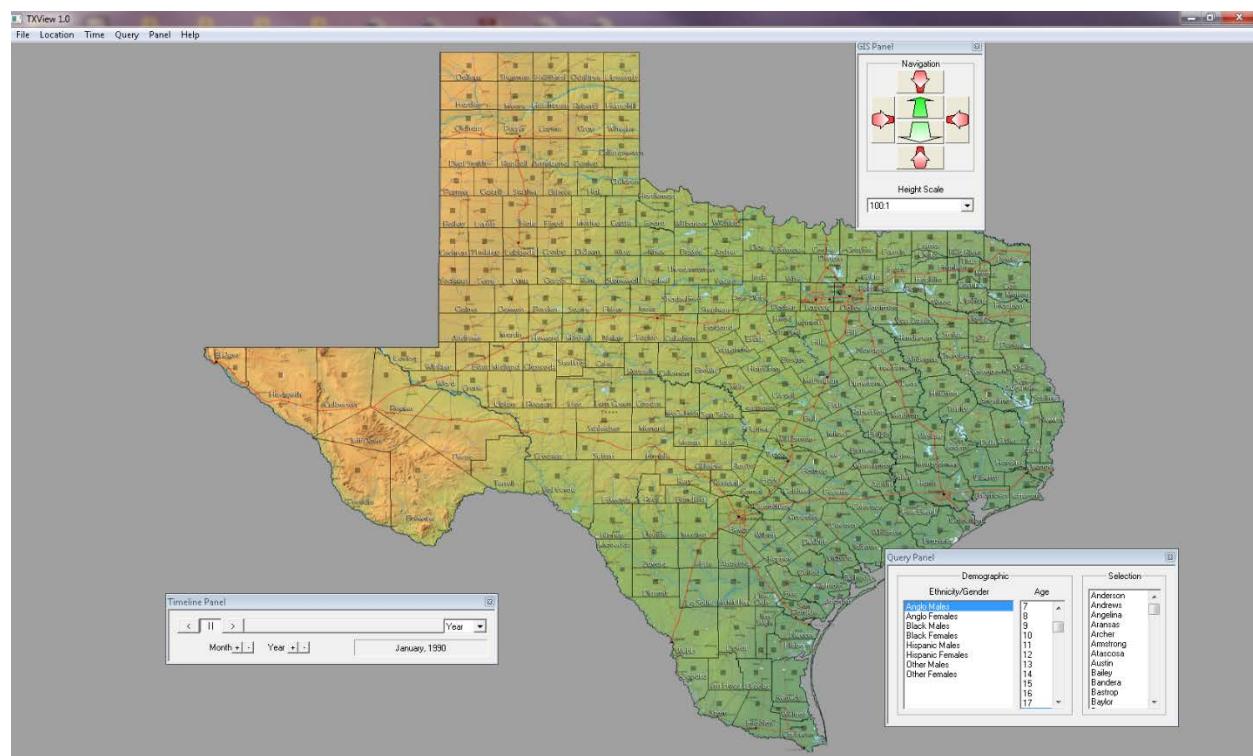

Figure 2: Example for Anglo Males 5 Years of Age and Under, for Texas and Bexar County
